

B2B Growth Funnel Analytics

Business Performance Review

Acquisition efficiency, funnel conversion, campaign economics, customer segments, and growth trends

Analysis period	January - June 2025
Scope	500 acquired leads
Data source	growth_analytics (MySQL)
Analytical stack	Python MySQL Power BI

Prepared as a concise management report from validated SQL analysis and the Power BI semantic model.

Executive overview

A concise view of the economics, funnel health, and the highest-priority management issues.

Revenue	ROAS	CAC	Lead-to-Customer
585.6K	29.42	414.73	9.60%

What the data says

- 48 of 500 acquired leads converted to customers. The final SQL-to-Customer transition is the largest funnel bottleneck.
- Referral is the strongest acquisition channel: 25.30% conversion, 49.37 CAC, 292.08 ROAS, and 51.71% of total revenue.
- LinkedIn is the weakest channel economically: 1.32% conversion, 6,902.85 CAC, and 1.98 ROAS.
- Enterprise accounts and Finance-oriented segments show the strongest customer economics.
- April is a material acquisition-quality anomaly: lead volume rose while conversion, revenue, and ROAS collapsed.

Management implication

Growth should be managed around qualified pipeline and revenue efficiency, not raw lead volume. The clearest value levers are late-stage conversion, referral scaling, and budget reallocation away from persistently weak campaigns.

Figure 1. Funnel progression from 500 leads to 48 customers.

Funnel and sales velocity

Conversion leakage and cycle time point to the same late-stage weakness.

1. Funnel performance

Transition	Start	Progressed	Conversion	Drop-off
Lead -> MQL	500	298	59.60%	40.40%
MQL -> SQL	298	147	49.33%	50.67%
SQL -> Customer	147	48	32.65%	67.35%

Primary bottleneck

The SQL-to-Customer stage loses 99 opportunities and converts only 32.65% of SQLs. Improving this stage can increase customer output without requiring a proportional increase in lead acquisition.

2. Sales velocity

Stage	Average days
Lead -> MQL	7.27
MQL -> SQL	11.79
SQL -> Customer	22.96
Full Lead -> Customer	41.19

The SQL-to-Customer stage is not only the lowest-converting step; it is also the longest, at 22.96 days on average. That alignment makes late-stage sales execution the highest-priority operational diagnosis.

Practical questions for sales review

- Are qualified opportunities receiving timely follow-up?
- Are qualification criteria consistent between marketing and sales?
- Are proposals, pricing, and objection handling creating avoidable friction?
- Are specific channels generating SQLs that sales teams cannot close efficiently?

Acquisition channel performance

Revenue concentration and unit economics vary materially by source.

Channel	Leads	Cust.	Conv.	Revenue	CAC	ROAS
Referral	83	21	25.30%	302,842.81	49.37	292.08
Email	111	14	12.61%	155,493.06	146.35	75.89
Webinar	52	4	7.69%	48,246.30	609.77	19.78
Organic Search	88	2	2.27%	12,034.67	375.54	16.02
Google Ads	90	6	6.67%	53,287.59	1,121.41	7.92
LinkedIn	76	1	1.32%	13,701.21	6,902.85	1.98

Figure 2. Referral significantly outperforms every other channel on ROAS.

Revenue concentration

Referral and Email together generate 78.26% of total revenue. Referral alone contributes 51.71%, making it both the primary growth engine and a source of concentration risk.

Google Ads and LinkedIn require particular scrutiny. Google Ads carries a CAC of 1,121.41 and ROAS of 7.92; LinkedIn is materially worse at 6,902.85 CAC and 1.98 ROAS. These channels should not be evaluated on lead volume alone.

Campaign performance

Campaign-level results explain why channel averages can hide important differences.

3. Strong campaigns

Campaign	Channel	Conv.	Revenue	ROAS
Partner Referral	Referral	25.71%	129,130.86	300.25
Customer Referral	Referral	25.00%	173,711.95	286.29
Product Update	Email	13.16%	70,795.55	94.19
Nurture Flow	Email	14.29%	44,140.62	69.12
Reactivation	Email	10.53%	40,556.89	61.57

4. Campaigns requiring attention

Campaign	Channel	Leads	Customers	Conv.	ROAS
ABM Decision Makers	LinkedIn	28	0	0.00%	0.00
Finance Leaders	LinkedIn	16	0	0.00%	0.00
Comparison Pages	Organic Search	23	0	0.00%	0.00
Competitor Terms	Google Ads	29	1	3.45%	4.50
Ops Leaders	LinkedIn	32	1	3.13%	4.76

Decision rule

Budget should be managed at both channel and campaign level. High-performing referral and email campaigns are candidates for controlled scaling; zero-conversion and persistently low-ROAS campaigns require testing, redesign, or reallocation.

Customer segment economics

The most valuable customer profiles are not the highest-volume segments.

5. Company size

Company size	Leads	Revenue	Conv.	CAC	ROAS	Avg. Cust. Rev.
Enterprise	106	206,695.97	11.32%	343.37	50.16	17,224.66
Mid-Market	183	199,023.26	9.84%	386.32	28.62	11,056.85
SMB	211	179,886.41	8.53%	490.73	20.37	9,993.69

6. Industry and cross-segment priorities

Finance is the strongest industry overall with 134,432.24 revenue, 14.49% conversion, 273.44 CAC, and 49.16 ROAS. At a more granular level, the highest-quality combinations are Finance x Mid-Market, Healthcare x Enterprise, Retail x Enterprise, Finance x Enterprise, and SaaS x Enterprise.

Segment	Conversion	Revenue / Lead	Quality Index
Finance x Mid-Market	17.86%	2,249.35	3.45
Healthcare x Enterprise	15.79%	2,460.57	3.41
Retail x Enterprise	14.29%	2,645.04	3.40
Finance x Enterprise	15.38%	2,299.86	3.25
SaaS x Enterprise	11.11%	2,422.54	2.92

Targeting implication

The portfolio should prioritize value density, not lead volume. SMB supplies the most leads, but Enterprise produces stronger conversion, lower CAC, higher ROAS, and higher average customer revenue.

Monthly trends and acquisition cohorts

The six-month trend reveals a sharp quality deterioration followed by partial recovery.

Figure 3. Revenue fell sharply through April before recovering in May and June.

Month	Leads	Customers	Conv.	Revenue	CAC	ROAS
Jan	95	13	13.68%	173,159.49	293.08	45.45
Feb	86	12	13.95%	152,220.49	332.37	38.16
Mar	72	7	9.72%	94,710.35	431.85	31.33
Apr	81	3	3.70%	15,316.75	1,073.33	4.76
May	75	5	6.67%	55,622.80	534.47	20.81
Jun	91	8	8.79%	94,575.76	399.17	29.62

April anomaly

Lead volume increased 12.50% month over month, but revenue fell 83.83%, conversion fell to 3.70%, CAC rose to 1,073.33, and ROAS fell to 4.76. This is a clear acquisition-quality breakdown.

May and June improved, but the 3-month rolling conversion rate still declined to 6.39% by June. The recovery therefore appears incomplete rather than a full return to January-February quality levels.

Recommendations and action plan

Actions are prioritized by expected business impact and the strength of supporting evidence.

Priority	Action	Rationale	Primary metric
1	Improve SQL -> Customer conversion	Largest drop-off and longest stage	SQL -> Customer %, cycle time
2	Protect and selectively scale Referral	Best conversion, CAC, ROAS and revenue	Conversion, CAC, ROAS
3	Investigate April quality collapse	Lead growth rose while revenue collapsed	Conversion, CAC, ROAS
4	Review LinkedIn and weak campaigns	Highest CAC; multiple zero-conversion campaigns	CAC, ROAS, customers
5	Prioritize Enterprise / Finance profiles	Strongest segment economics	Revenue, conversion, ROAS
6	Track efficiency with lead growth	Lead volume can diverge from business value	Revenue / lead, rolling conversion

Immediate management actions

- Run a sales-stage diagnostic on the 99 SQLs that did not convert, with emphasis on follow-up time, proposal friction, objections, and qualification quality.
- Protect referral programs and test controlled volume expansion rather than making an abrupt budget shift.
- Pause or redesign zero-conversion campaigns before allocating incremental spend.
- Review April campaign mix and lead-source changes to identify the cause of the quality collapse.
- Use Enterprise and Finance-oriented segments as high-priority targeting and sales-routing profiles.

Bottom line

The portfolio does not have a lead-volume problem as much as an efficiency-allocation problem. The strongest gains are likely to come from better late-stage conversion, more disciplined budget allocation, and higher concentration on proven customer profiles.

Methodology note

This report summarizes validated SQL outputs from the growth_analytics database for January-June 2025. Acquisition cohorts describe lead acquisition month and subsequent conversion; they are not retention cohorts because the dataset does not contain post-purchase behavior, renewals, or churn. Small campaign and segment samples should be interpreted with appropriate caution.
